Protocol for the Examination of Specimens from Patients with Tumors of the Brain/Spinal Cord

Protocol applies to all primary neoplasms of the brain/spinal cord/peripheral nerve and pituitary. Metastatic tumors are not included.

No AJCC/UICC TNM Staging System
Protocol web posting date: June 2008
Protocol effective date: February 2009

Procedures
• Biopsy/Resection

The College does not permit reproduction of any substantial portion of these protocols without its written authorization. The College hereby authorizes use of these protocols by physicians and other health care providers in reporting on surgical specimens, in teaching, and in carrying out medical research for nonprofit purposes. This authorization does not extend to reproduction or other use of any substantial portion of these protocols for commercial purposes without the written consent of the College.

The CAP also authorizes physicians and other health care practitioners to make modified versions of the Protocols solely for their individual use in reporting on surgical specimens for individual patients, teaching, and carrying out medical research for non-profit purposes.

The CAP further authorizes the following uses by physicians and other health care practitioners, in reporting on surgical specimens for individual patients, in teaching, and in carrying out medical research for non-profit purposes: (1) Dictation from the original or modified protocols for the purposes of creating a text-based patient record on paper, or in a word processing document; (2) Copying from the original or modified protocols into a text-based patient record on paper, or in a word processing document; (3) The use of a computerized system for items (1) and (2), provided that the Protocol data is stored intact as a single text-based document, and is not stored as multiple discrete data fields.

Other than uses (1), (2), and (3) above, the CAP does not authorize any use of the Protocols in electronic medical records systems, pathology informatics systems, cancer registry computer systems, computerized databases, mappings between coding works, or any computerized system without a written license from CAP. Applications for such a license should be addressed to the SNOMED Terminology Solutions division of the CAP.

Any public dissemination of the original or modified Protocols is prohibited without a written license from the CAP.

The College of American Pathologists offers these protocols to assist pathologists in providing clinically useful and relevant information when reporting results of surgical specimen examinations of surgical specimens. The College regards the reporting elements in the “Surgical Pathology Cancer Case Summary (Checklist)” portion of the protocols as essential elements of the pathology report. However, the manner in which these elements are reported is at the discretion of each specific pathologist, taking into account clinician preferences, institutional policies, and individual practice.

The College developed these protocols as an educational tool to assist pathologists in the useful reporting of relevant information. It did not issue the protocols for use in litigation, reimbursement, or other contexts. Nevertheless, the College recognizes that the protocols might be used by hospitals, attorneys, payers, and others. Indeed, effective January 1, 2004, the Commission on Cancer of the American College of Surgeons mandated the use of the checklist elements of the protocols as part of its Cancer Program Standards for Approved Cancer Programs. Therefore, it becomes even more important for pathologists to familiarize themselves with these documents. At the same time, the College cautions that use of the protocols other than for their intended educational purpose may involve additional considerations that are beyond the scope of this document.

The inclusion of a product name or service in a CAP publication should not be construed as an endorsement of such product or service, nor is failure to include the name of a product of service to be construed as disapproval.
Important Note

This protocol should be applied to all primary neoplasms of the brain/spinal cord/peripheral nerve and pituitary, and it should be applied at initial biopsy/resection. Metastatic tumors are not included. There is no American Joint Committee on Cancer / International Union Against Cancer TNM classification system for primary nervous system neoplasms. The World Health Organization (WHO) grading system is recommended.
Surgical Pathology Cancer Case Summary (Checklist)

Protocol web posting date: June 2008
Protocol effective date: February 2009

BRAIN/SPINAL CORD: Biopsy/Resection

Check 1 Response Unless Otherwise Indicated

*History of Previous Tumor/Familial Syndrome (Note A)
*___ None known
*___ Known (specify, if known: _______________________
*___ Not specified

Specimen Type/Procedure (Note B)
___ Open biopsy
___ Resection
___ Stereotactic biopsy
___ Other (specify): _____________________
___ Not specified

Specimen Handling (check all that apply) (Note C)
___ Squash/smear/touch preparation
___ Frozen section
___ Tissue for electron microscopy
___ Frozen tissue
___ Unfrozen for routine permanent paraffin sections
___ Other (specify): _____________________
___ Not specified

*Specimen Size (Note D)
*___ Greatest dimension: ___ cm
*___ Additional dimensions: ___x___ cm (for fragmented tissue, an aggregate size may be given)
*___ Cannot be determined (see Comment)

Laterality
___ Right
___ Left
___ Bilateral
___ Not specified
___ Not applicable

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
Tumor Site (check all that apply) (Note E)
___ Skull
   * Specify further (eg, frontal, parietal, temporal, occipital), if known:

___ Dura
   * Specify further (eg, cerebral [convexity/lobe, falx, tentorium, sphenoid wing, skull base, other], spinal or other), if known:____________________

___ Leptomeninges
   * Specify further (eg, cerebral [convexity/lobe], spinal, or other), if known:____________________

___ Brain/cerebrum
   * Specify lobe(s) (eg, frontal, temporal, parietal, occipital), if known:____________________

___ Brain, other:
   ___ Basal ganglia
   ___ Thalamus
   ___ Hypothalamus
   ___ Pineal
   ___ Cerebellum
   ___ Cerebellopontine angle
   ___ Suprasellar
   ___ Sella
   ___ Other (specify, if known:____________________)

___ Cranial nerve
   * Specify I-XII, if known:____________________

___ Ventricle
   * Specify lateral, third, fourth, cerebral aqueduct, if known:____________________

___ Brainstem
   * Specify midbrain, pons, or medulla, if known:____________________

___ Spine (vertebral column)
   * Specify bony level (eg, C5, T2, L3), if known:____________________

___ Spinal Cord
   * Specify bony level (eg, C5, T2, L3), if known:____________________
   * Specify spinal location (eg, extradural, intradural-extramedullary, intramedullary, conus medullaris, filum terminale), if known:____________________

___ Spinal nerve root(s)
   * Specify bony level (eg, C5, T2, L3), if known:____________________
   * Specify location (eg, intradural, foramen), if known:____________________

___ Cranial or peripheral nerve
   * Specify site, if known:____________________

___ Ganglion
   * Specify site, if known:____________________

___ Other (specify):____________________
___ Not specified

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
Histologic Type and Grade (applicable World Health Organization [WHO] classification and grade) (check all that apply) (Note F, Note G)

**Astrocytic Tumors**
- ___ Pilocytic astrocytoma (WHO grade I)
- ___ Pilomyxoid astrocytoma (WHO grade II)
- ___ Subependymal giant cell astrocytoma (WHO grade I)
- ___ Pleomorphic xanthoastrocytoma (WHO grade II)
- ___ Pleomorphic xanthoastrocytoma with anaplastic features (WHO grade not assigned)
- ___ Diffuse astrocytoma (WHO grade II)
  - ___ Fibrillary astrocytoma (WHO grade II)
  - ___ Protoplasmic astrocytoma (WHO grade II)
  - ___ Gemistocytic astrocytoma (WHO grade II)
- ___ Anaplastic astrocytoma (WHO grade III)
- ___ Glioblastoma (WHO grade IV)
  - ___ Giant cell glioblastoma (WHO grade IV)
  - ___ Gliosarcoma (WHO grade IV)
- ___ Gliomatosis cerebri (usually WHO grade III; diagnosis requires clinical-pathological correlation)
- ___ Astrocytoma, not otherwise characterized (WHO grades I-IV)

**Oligodendrogial Tumors**
- ___ Oligodendroglioma (WHO grade II)
- ___ Anaplastic oligodendroglioma (WHO grade III)

**Oligoastrocytic Tumors (mixed glioma)**
- ___ Oligoastrocytoma (WHO grade II)
- ___ Anaplastic oligoastrocytoma (WHO grade III)

**Ependymal Tumors**
- ___ Subependymoma (WHO grade I)
- ___ Myxopapillary ependymoma (WHO grade I)
- ___ Ependymoma (WHO grade II)
  - ___ Cellular ependymoma (WHO grade II)
  - ___ Papillary ependymoma (WHO grade II)
  - ___ Clear cell ependymoma (WHO grade II)
  - ___ Tanyctic ependymoma (WHO grade II)
- ___ Anaplastic ependymoma (WHO grade III)

**Choroid Plexus Tumors**
- ___ Choroid plexus papilloma (WHO grade I)
- ___ Atypical choroid plexus papilloma (WHO grade II)
- ___ Choroid plexus carcinoma (WHO grade III)

* Data elements *with asterisks* are *not required* for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
**Other Neuroepithelial Tumors**
- Astroblastoma (WHO grade not assigned)
- Chordoid glioma of the third ventricle (WHO grade II)
- Angiocentric glioma (WHO grade I)

**Neuronal and Mixed Neuronal-Glial Tumors**
- Dysembryoplastic neuroepithelial tumor (WHO grade I)
- Gangliocytoma (WHO grade I)
- Ganglioglioma (WHO grade I)
- Anaplastic ganglioglioma (WHO grade III)
- Central neurocytoma (WHO grade II)
- Extraventricular neurocytoma (WHO grade II)
- Cerebellar liponeurocytoma (WHO grade II)
- Papillary glioneuronal tumor (PGNT) (WHO grade I)
- Rosette-forming glioneuronal tumor of the fourth ventricle (RGNT) (WHO grade I)
- Paraganglioma of the spinal cord (WHO grade I)

**Tumors of the Pineal Region**
- Pineocytoma (WHO grade I)
- Pineal parenchymal tumor of intermediate differentiation (WHO II-III)
- Pineoblastoma (WHO grade IV)
- Papillary tumor of the pineal region (WHO grade II-III)

**Embryonal Tumors**
- Medulloblastoma, not otherwise characterized (WHO grade IV)
- Desmoplastic/nodular medulloblastoma (WHO grade IV)
- Medulloblastoma with extensive nodularity (WHO grade IV)
- Anaplastic medulloblastoma (WHO grade IV)
- Large cell medulloblastoma (WHO grade IV)
- Central nervous system (CNS) primitive neuroectodermal tumor (PNET) (WHO grade IV)
- Medulloepithelioma (WHO grade IV)
- Neuroblastoma (WHO grade IV)
- Ganglioneuroblastoma (WHO grade IV)
- Ependymoblastoma (WHO grade IV)
- Atypical teratoid/rhabdoid tumor (WHO grade IV)

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
Tumors of Cranial and Paraspinal Nerves

___ Schwannoma (WHO grade I)
    ___ Cellular (WHO grade I)
    ___ Plexiform (WHO grade I)
    ___ Melanotic (WHO grade I)
___ Neurofibroma (WHO grade I)
    ___ Plexiform (WHO grade I)
___ Perineurioma (WHO grade I)
    ___ Intraneural perineurioma (WHO grade I)
    ___ Soft tissue perineurioma (WHO grade I)
___ Ganglion neuroma (WHO grade I)
___ Malignant peripheral nerve sheath tumor (MPNST) (WHO grade II-IV)
    (Note H, Note I)
        ___ Epithelioid (WHO grade II-IV)
        ___ MPNST with divergent mesenchymal and/or epithelial differentiation
            (WHO grade II-IV)

Tumors of the Meninges/Meningothelial Cells

___ Meningioma (WHO grade I)
    ___ Meningothelial (WHO grade I)
    ___ Fibrous (fibroblastic) (WHO grade I)
    ___ Transitional (mixed) (WHO grade I)
    ___ Psammomatous (WHO grade I)
    ___ Angiomatous (WHO grade I)
    ___ Microcystic (WHO grade I)
    ___ Secretory (WHO grade I)
    ___ Lymphoplasmacyte-rich (lymphoplasmacytic) (WHO grade I)
    ___ Metaplastic (WHO grade I)
___ Atypical meningioma (WHO grade II)
___ Clear cell meningioma (WHO grade II)
___ Chordoid meningioma (WHO grade II)
___ Anaplastic meningioma (WHO grade III)
___ Papillary meningioma (WHO grade III)
___ Rhabdoid meningioma (WHO grade III)
___ Other (specify): ________________________

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
Mesenchymal (Nonmeningothelial) Tumors (Note I)
___ Lipoma
___ Angiolipoma
___ Hibernoma
___ Liposarcoma (intracranial)
___ Solitary fibrous tumor
___ Fibrosarcoma
___ Malignant fibrous histiocytoma
___ Leiomyoma
___ Leiomyosarcoma
___ Rhabdomyoma
___ Rhabdomyosarcoma
___ Chordroma
___ Chondrosarcoma
___ Osteosarcoma
___ Osteochondroma
___ Hemangioma
___ Epithelioid hemangioendothelioma
___ Hemangiopericytoma
___ Angiosarcoma
___ Kaposi sarcoma
___ Chordoma
___ Mesenchymal, nonmeningothelial tumor, other (specify type, if possible):

___ Sarcoma, primary CNS (specify type, if possible):

Primary Melanotic Tumors
___ Diffuse melanocytosis
___ Melanocytoma
___ Malignant melanoma
___ Meningeal melanomatosis

Tumors of Uncertain Histogenesis
___ Hemangioblastoma (WHO grade I)

Lymphoma and Hematopoietic Tumors
___ Malignant lymphoma (specify type, if possible):
___ Plasmacytoma
___ Granulocytic sarcoma
___ Hematopoietic neoplasm, other (specify type, if possible):

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
Germ Cell Tumors
___ Germinoma
___ Embryonal carcinoma
___ Yolk sac tumor
___ Choriocarcinoma
___ Teratoma, mature
___ Teratoma, immature
___ Teratoma with malignant transformation
___ Malignant mixed germ cell tumor (specify components, eg, germinoma, embryonal, yolk sac, choriocarcinoma, teratoma): __________________________

Tumors of the Sellar Region
___ Craniopharyngioma, adamantinomatous (WHO grade I)
___ Craniopharyngioma, papillary (WHO grade I)
___ Granular cell tumor (WHO grade I)
___ Pituicytoma (WHO grade I)
___ Spindle cell oncocytoma (WHO grade I)
___ Pituitary adenoma (specify nonfunctional or hormone expression, if known):
__________
___ Pituitary carcinoma
___ Pituitary hyperplasia
___ Other (specify): __________________________

Other/Nonclassifiable
___ Other(s) (specify): _________________________
___ Malignant neoplasm, type cannot be determined

Histologic Grade (WHO histologic grade) (Note G)
___ Not applicable
___ Cannot be determined
___ WHO grade I
___ WHO grade II
___ WHO grade III
___ WHO grade IV
___ WHO grade not assigned
___ Other (specify): ______________________

Margins (for resections of malignant peripheral nerve sheath tumors only) (Note H)
___ Cannot be assessed
___ Margins not involved by tumor
___ Margins involved by tumor
*Specify, if possible: _______________________

* Data elements with asterisks are not required for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.
*Ancillary Studies (check all that apply)
  *___ None performed
  *___ Immunohistochemistry (specify): ____________________________
  *___ Electron microscopy
  *___ Molecular genetic studies (specify): ____________________________ (Note J)
    *___ 1p deletion identified
    *___ 1p deletion not identified
    *___ 19q deletion identified
    *___ 19q deletion not identified
    *___ Other (specify): ____________________________
  *___ Other (specify): ____________________________

*Additional Pathologic Findings
  *Specify: ____________________________

*Comment(s): ____________________________
Explanatory Notes

A. Relevant History

Patient Age
Patient age may be critically important for predicting tumor behavior. For example, patient age is predictive of survival in many malignant CNS neoplasms. For diffusely infiltrating astrocytomas, age and histologic grade are the two strongest predictors of patient outcome, with patient age greater than 50 years and high-grade histologic features serving as negative indicators.1-4

Duration of Symptoms
A long clinical history of CNS symptoms or seizures prior to the diagnosis of a CNS tumor is suggestive of origin from a slowly growing neoplasm. Alternatively, a sudden onset of clinical symptoms or a rapidly progressive neurological deficit may be indicative of a high-grade tumor, hemorrhage, infarct, active demyelinating disease, or edema associated with some other benign or low-grade lesion.

Previous Diagnoses or CNS Biopsies
Knowledge of the presence or absence of previous intracranial or extracranial disease (eg, immunosuppression, previous CNS or other primary neoplasm) is essential for specimen interpretation. If a previous tumor is included in the differential diagnosis, it is useful to have microscopic slides of the lesion available for review and comparison.

Preoperative Treatment
Knowledge of preoperative treatment, including radiation therapy, corticosteroid therapy, chemotherapy, and other therapy, is helpful for specimen interpretation. In particular, prior radiation therapy or radiosurgery may alter the interpretation of specimens in which there are increased cellular atypia, decreased proliferative activity, or large areas of radiation-induced change (eg, coagulative [nonpalisading] necrosis, vascular hyalinization, and gliosis).

Family History of Cancer or Primary CNS Tumors
Several genetic conditions/syndromes are associated with an increased predisposition to the development of certain brain neoplasms (eg, neurofibromatosis types 1 and 2, Turcot/Lynch, tuberous sclerosis, von Hippel-Lindau, Cowden, Li-Fraumeni, and Gorlin syndromes).

Relevant Radiographic Imaging Features
Knowledge of neuroimaging features is extremely helpful in specimen interpretation. A differential diagnosis may be generated based on patient age, tumor location, and neuroimaging features. Neuroimaging also can be helpful in providing correlation with or highlighting discrepancy with pathologic diagnosis (eg, contrast enhancement with hypocellularity). A close collaboration with the neuroradiologist and neurosurgeon is essential.

B. Specimen Type/Procedure
It is useful to know if the specimen was procured by open craniotomy or stereotactic biopsy. Since tumors may be heterogeneous, adequate sampling is an issue. The reliability of the prognostic information derived from such specimens may vary depending on how the specimen was obtained.
C. Specimen Handling, Triage, and Special Procedures

It may be necessary to divide biopsy/resection tissue into portions for the following procedures:

- Squash/smear/touch preparations
- Frozen sections
- Unfrozen routine permanent paraffin sections (essential to avoid artifacts)
- Electron microscopy (retain a small portion in glutaraldehyde, or "embed and hold" for electron microscopy, if necessary)
- Frozen tissue, for possible molecular diagnostic studies (freeze fresh tissue as soon as possible and store)
- Other (microbiology, flow cytometry, cytogenetics, molecular diagnostics)

Since cellular details are very important in interpreting CNS neoplasms, previously frozen tissue with its inherent artifacts is suboptimal, especially for subclassifying and grading gliomas. Recommendations for optimally freezing and cutting frozen sections from tissue from the brain and spinal cord have been published. It is imperative to retain tissue that has not been previously frozen for permanent sections. Avoid using sponges in cassettes because they produce angular defects that resemble vascular/luminal spaces in the final sections. Wrapping small biopsies in lens paper, or placement into agar or into tissue sacs prior to submitting in cassettes, is recommended. If biopsy frozen and permanent sections are nondiagnostic, tissue that was retained in glutaraldehyde may be submitted for additional paraffin sections.

If touch preparations are used, the presence of cells with delicate processes on smear/squash preparations is suggestive of a primary CNS neoplasm. The formation of processes and cytoplasmic fibrillarity may be seen in reactive astrogliosis. The identification of macrophages is important since a macrophage-rich lesion is more likely a subacute infarct or demyelination, rather than a neoplasm.

If an infectious etiology is suspected, the neurosurgeon should be alerted to submit a fresh sample to microbiology to be processed for bacterial, fungal, and/or viral cultures.

If a lymphoproliferative disorder is suspected and sufficient tissue is available, a portion of fresh tissue should be set aside for appropriate workup.

D. Specimen Size

For most CNS tumors, specimen size is of limited significance, with optimal preservation and processing of greater importance. In heterogeneous lesions, issues of tissue sampling may become important.

E. Primary Tumor Location and Size

Since the anatomic site of a neoplasm may correlate with tumor type and prognosis, it should be recorded, if known.

F. Histologic Type

Classification of tumors should be made according to the WHO classification of tumors of the nervous system whenever possible.
G. Histologic Grade

The WHO grading\(^6,7\) of some of the more common CNS tumors is shown in Table 1. There is no formal TNM-based classification and staging system for CNS tumors.

H. Margins
With the exception of malignant peripheral nerve sheath tumors, resection margins provide no prognostic information and generally are not required for most CNS neoplasms.

I. Mesenchymal Tumors
Mesenchymal tumors vary widely in grade, from benign tumors (WHO grade I) to highly malignant sarcomas (WHO grade III to IV). The classification and grading of these lesions is performed as for the corresponding tumor of soft tissue and bone, as detailed in the WHO monograph, *Tumours of Soft Tissue and Bone*, and the College of American Pathologists bone and soft tissue cancer protocol.

J. Molecular Genetic Studies
Recent studies have shown that combined 1p and 19q deletions in oligodendrogliomas are associated with enhanced chemoresponsiveness and improved survival. In addition, several other rapidly emerging molecular markers are providing useful diagnostic and prognostic information. For example, *EGFR* amplification may be useful in distinguishing high-grade astrocytoma from anaplastic oligodendroglioma; n-Myc amplification has prognostic significance in medulloblastomas; and *INI1* studies are useful in the diagnosis of atypical teratoid/rhabdoid tumor.
